

» Estimation of free riding in plastic package waste using put-on-market and business turnover information

Joao Lopes

Nuno Romao

Filipa Chambel

DMSI / ME

October 2023

Aim

» Calculate non-recycled plastic packaging waste

- Since 2020, EU member states contribute based on non-recycled;
- Non-recycled reported plastic packages put on market (POM);
- And undeclared plastic packages POM.

» Calculate undeclared plastic packages POM

- Annual business turnover (TO);
- Reported plastic packages POM.

Introduction > basic method

» Establish relation between reported POM and TO

- $k = \frac{POM_{\text{reported}}}{TO_{\text{reported}}};$
- $POM_{\text{unreported}} = TO_{\text{unreported}} \times k.$

» Estimate total

- $POM_{\text{total}} = POM_{\text{reported}} + POM_{\text{unreported}};$
- $c = \frac{POM_{\text{total}}}{POM_{\text{reported}}}.$

Introduction > procedure

» Procedure

1. Divide businesses in moderately homogeneous clusters;
2. Choose clusters with high-chance of free riding;
3. Define k for each chosen cluster.

» Main assumption

- Ratio k capture characteristics of groups of businesses.

Data > data source

» From Statistics Portugal

- Business TO from sales of goods and sales of products;
- Number of employees (NOE);
- Economic activity classification with 5 levels (CAE3).

» Limitations

- Data can be updated/corrected by businesses after retrieving;
- Data goes through checks and validation after retrieving;
- Only businesses located in Portugal (and not full universe).

Data > data source

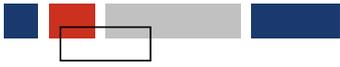

» From APA

- Municipality POM via Producer Responsibility Organizations (PRO);
- Non-municipality POM directly via producers.

» Limitations

- New clients adhere retroactively;
- Data can be updated/corrected by businesses after retrieving;
- Smaller businesses do not report values (use of estimates);
- Data from producers not consolidated.

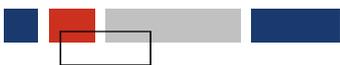

Data > data merging

» Create final dataset

- Secondary CAE3 reported as main activity;
- Sum over sale of goods and sale of products as total TO;
- Sum over municipality and non-municipality POM.

ID	NAME	YEAR	CAE3	NOE	POM	TO	<i>k</i>
999999990	business1	2014	47111	201	152	3512	0.04
999999990	business1	2015	47111	203	164	3812	0.04
...

Methods > business clusters

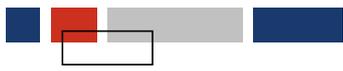

» Cluster characterization

- Main variables: POM, TO, *k*;
- Summary statistics: n , t , \hat{m} , sd , CV .

» Creating clusters

- Economic activity classification (CAE3): A, C, G, I, N;
- Number of employees (NOE): micro, small, medium, large.

Methods > business clusters

» Criteria

1. Representativeness in numbers of business [$n_{TO}' / (n_{TO} + n_{TO}')$];
2. Representativeness in business turnover [$t_{TO}' / (t_{TO} + t_{TO}')$];
3. Robustness of the estimate of k [n_k];
4. Homogeneity of clusters regarding k [CV_k].

» Selecting clusters for estimation (via thresholds)

- Aggregating/Disaggregating clusters;
- Discarding clusters with low-chance of free-riding.

Methods > business clusters

» Criteria

1. Representativeness in numbers of business [$n_{TO}' / (n_{TO} + n_{TO}')$];
2. Representativeness in business turnover [$t_{TO}' / (t_{TO} + t_{TO}')$];
3. Robustness of the estimate of k [n_k];
4. Homogeneity of clusters regarding k [CV_k].

» Naive first approach

- Educated *ad hoc* method (36 clusters);
- Threshold for free riding ($c = POM_{total} / POM_{reported} < 5$).

Methods > calculate ratio k

» Different approaches

- Ratio of summary statistics $k_{totals} = \frac{\sum_i^n POM_i}{\sum_i^{n'} TO_i}$;
- Summary statistics of ratio $k_{mean} = \sum_i^n \frac{POM_i}{TO_i} / n = \sum_i^n k_i / n$.

» Advantage of summary statistics of ratio

- Analyse ratios at microdata level;
- Inform about quality of estimates (e.g. confidence intervals).

» Disadvantage of summary statistics of ratio

- Sensitive to large discrepancies.

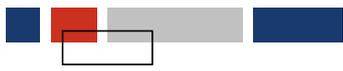

Methods > assumptions

- Complete data on municipality and non-municipality POM;
- No overlap between municipality and non-municipality POM;
- Value of goods only from plastic packages;
- **Non-declarants are free riders;**
- **Homogenization within clusters of businesses;**
- Complete data on TO of national businesses; **overestimation**
- Negligible secondary economic activity;

- No free riding in discarded clusters;
- **Complete data on TO of foreigner businesses.** **underestimation**

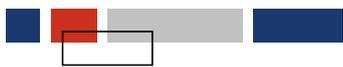

Exploratory results > tables

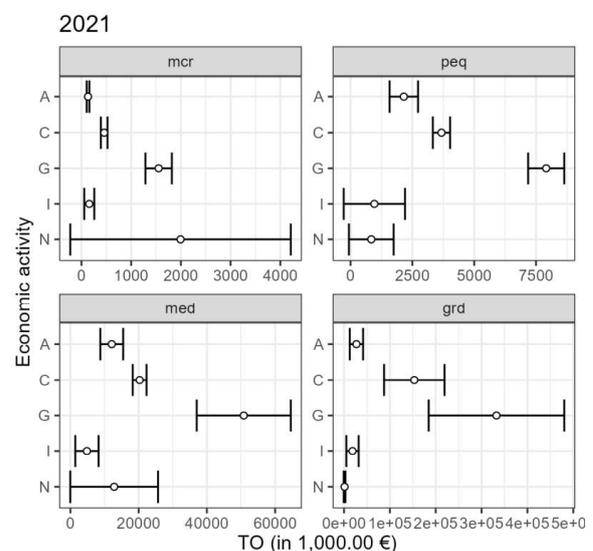

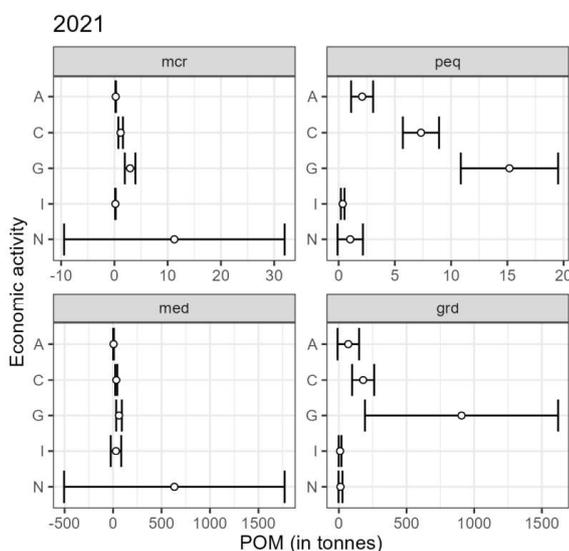

» Description of POM (10³ t), TO (10⁶ €) and *k* (kg/€)

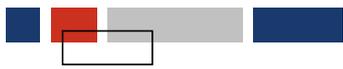

CAE	<i>n</i> _{report}	POM _{report}	TO _{report}	<i>k</i> _{means}	<i>n</i> _{unreport}	TO _{unreport}
A	852	1.0	829	0.017	126796	6,976
C	3779	854.3	61,184	0.014	66662	34,694
G	3625	132.6	64,325	0.004	221877	87,832
I	148	0.6	192	0.006	115858	1,039
N	68	4.3	116	0.096	187655	1,232
other	384	1.2	5,098	-	664463	33,613
unavailable	358	2.0	-	-	-	-

Exploratory results > plots

» Estimates of POM and TO

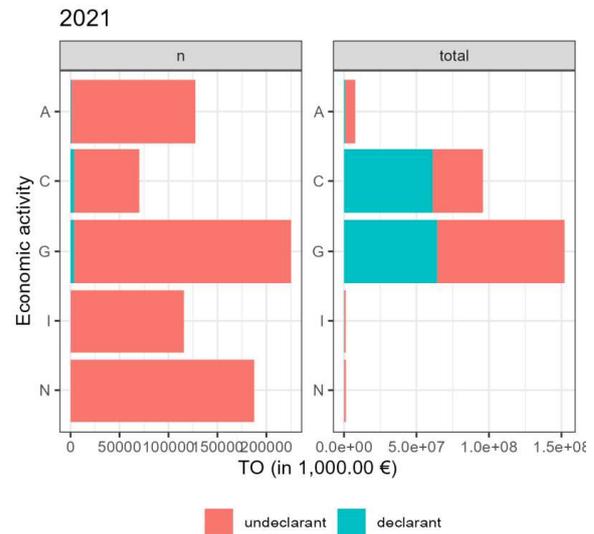

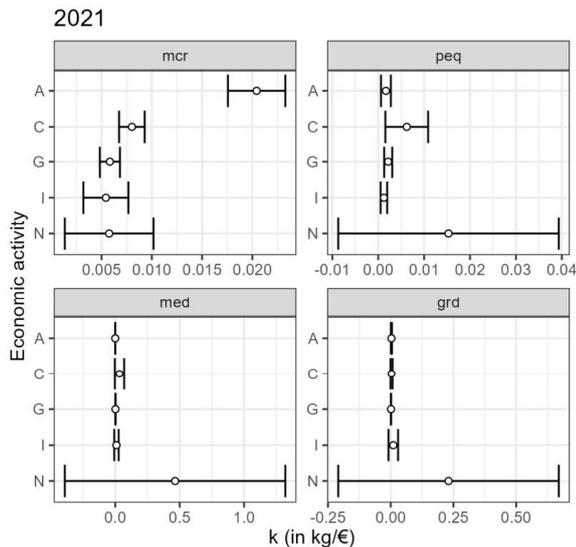

Exploratory results > plots

» Estimates of k and proportion of declarants

Future work

- Preserving data on non-municipality POM;
- Using robust summary statistics;
- Disaggregating clusters of businesses;
- **Choosing clusters of businesses;**
- **Choosing values of thresholds (sensitivity analysis);**
- Filtering out businesses for calculating ratios k ;
- Accounting for discarded clusters of businesses;
- Other future developments.

Thank You

Annexes

» Categories of economic activity

	description	2 digits	3 digits	4 digits	5 digits
A	Agriculture, forestry and fishing	3	13	39	49
C	Manufacturing	24	95	230	332
G	Wholesale and retail trade...	3	21	91	124
I	Accommodation and food...	2	7	9	34
N	Administrative and support...	6	19	33	35

» Categories of number of employees

	description	definition
mcr	Micro-size business	$\text{NOE} \leq 10$ employees
peq	Small-size business	$11 \text{ employees} < \text{NOE} \leq 50$ employees
med	Medium-size business	$51 \text{ employees} < \text{NOE} \leq 250$ employees
grd	Large-size business	$\text{NOE} > 250$ employees

Data > data merging

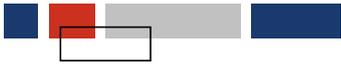

» Main problem

- Prior 2017: reports on non-municipality POM by PROs;
- 2017 onwards: reports on non-municipality POM by producers;
- Data consolidation not performed in reports by producers.

» Solution

- Outlier diagnosis and imputation (before merge) – check integrity;
- Outlier diagnosis and imputation (after merge) – soften transition.

Data > data merging

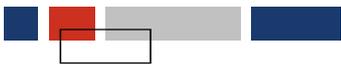

» Internal outlier diagnosis (across time)

- $x > Q75 + 3 \times IQR;$
- $x > 10 \times Q50.$

» External outlier diagnosis (across businesses)

- $x > Q75 + 3 \times IQR;$
- $x > Q99.$

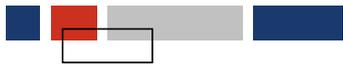

Data > data merging

» Categories of outliers

- scalar: values reported in Kg (instead of tonnes) - scale down value;
- replace: clerical errors - replace value by median per business;
- ignore: incorrect labelling as non-municipal - replace value by 0;
- keep: incorrect identification as outlier - keep value.

Exploratory results > tables

» Description of non-household POM (10³ ton)

Outlier treatment	2021	2020	2019	2018	2017
